The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the

A new minor histocompatibility antigen, HA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treatment of severe aplastic anaemia, leukaemia, and immune deficiency diseases  \label{eq:condition} % \begin{array}{ll} & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ \end{array} 
                                                                                                                                                                                              The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency

The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A new minor histocompatibility antigen, diseases and prevent rejection and host marrow and organ transplantation.
                                                                                                                                                                                                                                                      T-cell epitope; minor histocompatibility antigen transplant rejection; Graft-versus-Host Disease; neoplastic haematopoietic cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents an immunogenic peptide constituting a T-cell epitope, obtainable from the minor histocompatibility antigen HA-1. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases.

Neoplastic haematopoietic cells presenting the peptides, in an HLA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, B-and T-cells

The present sequence represents part of the minor histocompatibility antigen HA-1 R-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as ever detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies
                                                                                                                                                                                                    Typing minor histocompatibility antigen HA-1 - identifying HA-1 R and HA-1 H alleles of HA-1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Intron; minor histocompatibility antigen HA-1; typing allele; H allele; R allele; polymorphic nucleotide; HA-1 typing; bone marrow transplant; severe aplastic anaemia; leukaemia; immune deficiency disease; ss.

                                                                                                   The invention relates to a novel method for providing epitopes of allelic convariants of antigenic proteins from specific species based on single concleotide polymorphism (SNP), by defining target protein/peptide or its subset, screening database of DNA encoding target protein/peptide or its converged to the protein of the invention, converged by DNA sequence having SNP, creating variant epitopes, converged by DNA sequence having SNP, creating variant epitopes, converged by DNA sequence having SNP, creating variant epitopes, converged by DNA sequence having SNP, creating variant epitopes, converged by DNA sequence having SNP, creating variant epitopes, converged by applying the method is converged by applying the method is converged by applying the method for several protein from the converged by applying the method for several protein from the converged by applying the method for several protein from the converged by applying the sprofile was related to disease, preferably cancer. This is useful for diagnosing a disease in an individual by converged by applying the SNP-related polymorphic profile. A method of the invention converged by the progression, regression or onset of a treated disease. The present converged by the progression, regression or onset of a treated disease. The present converged by the progression in the exemplification of the invention.

                                                                                                                                                                          The invention relates to a novel method for providing epitopes of allelic convariants of antigenic proteins from specific species based on single conclectide polymorphism (SNP), by defining target protein/peptide or its converted to the protein protein dentifying, conclecting allelic peptide/protein variants, expression product or its configuration of the invention has cytostatic activity, and may have a use in a vaccine. The method is concertified by applying the method for several protein from the concertifies where the SNP profile of one or more individuals from a concertified where the SNP profile was related to disease, preferably cancer. This is useful for diagnosing a disease in an individual by cancer. This is useful for diagnosing a disease in an individual by concertified the SNP-related polymorphic profile. A method of the invention concertified the snP-related polymorphic profile. A method of the invention concertified the snP-related polymorphic profile. A method of the invention concertified the snP-related polymorphic profile. A method of the invention concertified polymorphic profile is determining cancer, preferably leukaemia, and for determining concertified polymorphic profile. A method of the invention concertified polymorphic profile is demanded to disease. The present concertified in the exemplification of the invention.
                                                                      Query Match

The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency diseases. The present sequence represents a KIAA0223 sequence given in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a new peptide (PI) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. PI is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency diseases. The present sequence represents a KIAA0223 sequence given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                 AAW97415 standard; protein; 13
Immunogenic peptide from minor histocompatibility antigen HA-1 - useful for inducing tolerance to transplants and prevent rejection or graft-
                                                                              Goulmy EAJM,

The specification describes an immunogenic peptide constituting a T-cell epitope, obtainable from the minor histocompatibility antigen HA-1. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic haematopoietic cells presenting the peptides, in an HIA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, B- and T-cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               T-cell epitope; minor histocompatibility antigen HA-1; vaccine; transplant rejection; Graft-versus-Host Disease; autoimmune disease; neoplastic haematopoietic cell; KIAA0223 polymorphism.

                                                                                                                                                         The invention relates to inhibiting or increasing programmed cell death of a cell. The method involves upregulating or inhibiting, respectively, the expression or activity of basic transcription factor (BTF) or its homologue in the cell. The BTF3 polypeptides and nucleic acids are useful for inhibiting or increasing programmed cell death. They are used for screening for an agent that increases or inhibits programmed cell death or pre-screening for an agent that modulates programmed cell death. The screened agent that increases or inhibits programmed cell death, is used for diagnosing or treating cancer or neurodegenerative disease (e.g. amyotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease or multiple sclerosis), atherosclerosis, or rheumatoid arthritis. Sequences ABF71106-123 represent CARD regions of various CARD proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 13

                                                                                                                                                    8
                                                                                                                                                                                                                                                                                     CC This invention relates to novel isolated or purified peptides of the CC human respiratory syncytial virus (RSV), in particular ten RSV genes CC encoding 11 separate viral proteins non-structural proteins NS-1 (also CC known as the 1C protein) & NS-2 (1B protein). a polymerase protein L and CC SH (also known as the 1A protein). Specifically, it refers to a CC composition comprising an above peptide mixed with a pharmaceutical excipient or an RSV immunogenic composition comprising a recombinant CC excipient or an RSV immunogenic acid insert encoding an above peptide. CC The present invention describes an in vitro method of detecting cytotoxic CC (MHC) class I restricted T-cell stimulating peptide pitope of RSV. The CC RSV peptide is useful for preparing a diagnostic composition or an RSV (prophylactic or therapeutic) vaccine composition for a DNA-based CC (immunisation, or for preparing an immune response provoking vaccine in the event of RSV infection (the vaccine being prepared by contacting the polypeptide in an immune response provoking an activity. This peptide sequence is a human RSV high binding affinity peptide of the

carnitine medium/long chain acyltransferase (EC 2.3.1.-) - rat (fragment)
N;Alternate names: endoplasmic reticulum protein ERp61; glucose regulated protein GRP58;
C;Species: Rattus norvegicus (Norway rat)
C;Date: 07-Oct-1994 #sequence_revision 07-Oct-1994 #text_change 07-May-1999
C;Accession: A61354
R;Murthy, M.S.R.; Pande, S.V.
Mol. Cell. Biochem. 122, 133-138, 1993
A;Title: Carnitine medium/long chain acyltransferase of microsomes seems to be the previ A;Reference number: A61354; MUID:94049728; PMID:8232244
A;Accession: A61354
A;Ccession: A61354
A;Accession: A61354
A;Accession: A61354
A;Residues: 1-10 cMUR>
A;Cross-references: UNIPARC:UPI000017C8DE
C;Keywords: acyltransferase

                                                                                                                  The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A new minor histocompatibility antigen, HA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 3; Page 32; 47pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-i-dictoria a colla anti-i-dictoria a co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Typing minor histocompatibility antigen HA-1 - by amplifying and identifying HA-1 R and HA-1 H alleles of HA-1, used for, e.g. det of genetic aberrances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                23-JUL-1997;
